IMPORTANT: Tier speeds (nbn plan speed) are the maximum possible download speeds available during off-peak periods. Typical evening speed measures network speed to customer premises, it is not a measure of customers' received in premises speed and are based data obtained from our suppliers on 12 March 2026.

Typical evening or busy period speeds: The "typical evening" or "busy period" speed is measured based on the network speed to a customer's premises, and is not a measure of speeds received by customers within their premises. This is not a guaranteed speed, and not every customer will receive the speeds advertised above. You will typically experience slower speeds than the maximum connection speeds available in the Plan which you have selected. You should refer to the typical speeds for a more accurate estimate of your experience.

Factors affecting Service speeds: The speed and performance of the Service depends on the Plan you select, and on a variety of factors, such as the server which you connect to or the equipment you use. We recommend setting up your modem in an elevated and central location in your premises, away from other electrical appliances or obstructions.

Power outages: Your Service will not work during a power outage. This means that you will not be able to use your broadband services if there is a power outage.

Medical and security alarms: If you have any medical and security alarms, you should contact your device provider to find out if your alarm or other devices will work with an nbn® service, and identify the available alternatives if they are not. Due to the limitations during a power outage, the Service is not suitable for

you if you have a serious or life-threatening medical condition that requires continuous use of the Service.
